

National Trends in Utilization & Outcomes of Angioplasty and Stenting for Intracranial Stenosis

Taylor Anne Wilson; Omar Tanweer MD; Howard A. Riina MD, FACS  
Department of Neurosurgery, New York University School of Medicine

Introduction

Angioplasty and intracranial stenting (ICS) are both endovascular revascularization procedures that have emerged as treatment options for intracranial atherosclerotic disease (ICAD). Some have suggested that angioplasty alone is an alternative to angioplasty with ICS. The role of these procedures for treatment of ICAD, however, remains unclear. This study examines recent trends in utilization and outcomes of angioplasty alone and ICS in the United States using a population-based cohort.

Methods

The National Inpatient Sample (NIS) database was queried for patients with ICAD who underwent angioplasty or ICS from 2005-2010. Patient demographics, characteristics, perioperative complications and discharge data were collected.

Results

During 2005-2010, the NIS captured 1,115 patients (angioplasty: n = 495, ICS: n = 620) with ICAD underwent endovascular revascularization. Over time, the total number of endovascular revascularization procedures increased. There was an increase in the percentage of symptomatic patients (p = 0.015) as well as in the number of comorbidities of patients treated (p < 0.001). Combined post-procedure stroke and death rates were 16% and 28.9% for angioplasty and ICS, respectively (p<0.001). Comparing by procedure, a larger percentage of angioplasty patients presented symptomatically compared to those who underwent ICS (p<0.001).

Multivariate Analysis for Predictors of Outcomes

|                       | Odds Ratio (OR) | p-value |
|-----------------------|-----------------|---------|
| Post-Procedure Stroke |                 |         |
| Symptomatic Pres.     | 5.2             | <0.001  |
| Death                 |                 |         |
| Age                   | -               |         |
| Symptomatic Pres.     | 10.6            | <0.001  |
| Angioplasty           | 1.9             | 0.001   |

Multivariate Analysis for Predictors of Hospital Utilization

|                       | p-value |
|-----------------------|---------|
| Length of Stay        |         |
| Age                   | <0.001  |
| Comorbidities         | <0.001  |
| Symptomatic Pres.     | <0.001  |
| Angioplasty           | 0.006   |
| Post-Procedure Stroke | <0.001  |
| Total Charges         |         |
| Age                   | <0.001  |
| Comorbidities         | <0.001  |
| Symptomatic Pres.     | <0.001  |
| Angioplasty           | 0.011   |
| Post-Procedure Stroke | <0.001  |

Conclusions

Although both angioplasty and ICS experienced an increase in utilization over time, the increase in utilization of ICS surpassed that of angioplasty. Angioplasty appears to be associated with higher rates of peri-procedural complications; however, that may represent patient selection bias. Further studies are needed to identify patients who would benefit from revascularization and to clarify the roles of angioplasty and ICS.

Learning Objectives

By the conclusion of this session, participants should be able to: 1) Describe and discuss in small groups the national trends in utilization and outcomes of endovascular revascularization procedures for ICAD, and 2) Identify treatment options, both endovascular and alternative, for ICAD.
